-!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
-!- SUBUNIT: Homodimer (By sullarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ξ.

-!- CATALYTIC ACTIVITY: ATP + glycerol = ADP + glycerol 3-phosphate.
-!- PATHWAY: Glycerol utilization; rate-limiting step.
-!- SIMILARITY: Belongs to the fucokinase / gluconokinase / glycerokinase / xylulokinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-NOV-1997 (Rel. 35, Created)

-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- DOWAIN: The N-terminus contains an autoinhibitory calmodulin-binding domain, which binds calmodulin in a calcium-dependent fashion (By similarity).
-!- SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IIB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BAC clones.";
Res. 7:217-221 (2000).
Res. 7:217-221 (2000).
FUNCTION: This magnesium-dependent enzyme catalyzes the hydrolysis of ATP coupled with the translocation of calcium from the cytosol out of the cell or into organelles (By similarity).

CATALYTIC ACTIVITY: ATP + H(2)O + Ca(2+) (Cis) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Arabidopsis thaliana (Mouse-ear cress).

Microtubule-actin crosslinking factor 1, isoforms 1/2/3 (Actin cross-
linking family protein 7) (Macrophin 1) (Trabeculin-alpha) (620 kDa
actin-binding protein) (ABP620).

                                                                                   Isold=Q9UPN3-3; Sequence=External;
TISSUE SPECIFICITY: Expressed in heart, lung, pituitary and
placenta, not found in brain, kidney, liver, pancreas or skeletal
                                                                                                                                                                                                                       -!- SIMILARITY: Belongs to the plakin or cytolinker family.
-!- SIMILARITY: Contains 2 EF-hand calcium-binding domains.
-!- SIMILARITY: Contains 19 plectin repeats.
-!- SIMILARITY: Contains 32 spectrin repeats.
 -1- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                            (POTENTIAL)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (POTENTIAL)

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequences AAYS8198-Y58200 represent synthetic peptides that correspond the extracellular regions of STRAP-1 (serpentine transmembrane antigen

WPI; 2001-367804/38.

```
the professe, AAYSB194. These peptiates were used to raise monocional anti-STRAP-1 antibodies, STRAP-1 is the prototype member of the STRAP-1 curtural conservation, but which show no significant structural extructural conservation, but which show no significant structural conservation, but which show no significant structural chromosome 7p22. STRAP-1 is thought to be a type IIIa membrane protein chromosome 7p22. STRAP-1 is a 339 amino acid protein characterised by six transmembrane domains and intracellular N- and C-termini, suggesting that it folds in a "serpentine" manner into three extracellular and two intracellular and throughout all stages of protein characterised by six and/or protein is also overexpressed in certain other cancers, including chief in a leader, color, pancreatic and ovarian cancer. The function of the STRAP protein is not known. They may be ion channels (from the presence of six transmembrane domains, a feature which is shared by certain ion channels) or gap-junction proteins (from immunohistochemical staining). STRAP-1 and syptems in munical staining). STRAP-1 and syptems in munical staining or cell-surface thus used to identify specific-binding protein induces cell-surface thusour antigenes. Immunication with a STRAP-1 and munical staining of cancers (or susceptibility to cancer), as therapeutic modulations or to target therapeutic agents to their site of action. STRAP concined acids may be used for recombinant protein production, as calls for screening inhibitions of STRAP expression since high levels of STRAP proteins are exposed on the cell surface, they are easily targetted by systemically administered agents they are easily targetted by systemically administered agents transpected to them should have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, cytostatic, antiproliferative, vaccine; gene therapy; six transmembrane epithelial antigen of the prostate-1, STEAP-1; chromosome 7p22.3; cancer; prostate; colon; bladder; pancreatic; ovarian; lung; extracellular loop; serpentine transmembrane antigen.

The present invention relates to human six transmembrane epithelial antigen of the prostate (STEAP) protein. STEAP is a member of cell surface serpeitine transmembrane antigens. STEAP gene is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, color, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP in a patient. Treating a vaccine composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, comprises administering to the patient of killing cells expressing STEAP, comprises administering to the patient accordence ancoding single chain monoclonal antibody that comprises the variable domains of the heavy and light chains of the monoclonal antibody that chains of the monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal antibody is expressed the cancer cells and intracellularly. The present sequence is extracellular loop of STEAP-1 surfable for cloning into PFC, which is used in the invention. STEAP-1 cere antipolar page of the chomosome 7P22.3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                        New STEAP (six transmembrane epithelial antigen of the prostate)
proteins, expressed in human cancers, useful for detecting and treating

This invention relates to polynuclectide sequences AAF63836
which encode human secreted proteins AAB75260 - AAB75287. Included in the
invention are protein sequences AAB75288 - AAB75341 which are fragments
of the secreted proteins and amino acid sequences with which these
cf fragments share homology. Examples of the activities of the proteins and
polynuclectides and the activities of their agonists and antagonists
include, immunosuppressive; autianthritic; antirheumatic;
antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective;
condropic; neuroprotective; antibacterial; virucide; fungicide;
copthalmalogical; and vulnerary activity. The protein and polynucleotide
sequences, their agonists and antagonists may be useful for treating,
coptasms of the breast or liver, cardiovascular disorders e.g.
chisases e.g. rheumatoid arthritis, hyperproliferative disorders e.g.
chisases of the breast or liver, cardiovascular disorders e.g. cardiac
arrest, cerebrovascular disorders e.g. cardiac
cartest, cerebrovascular disorders e.g. cerebral ischaemaia, anglogenesis,
cartest, cerebroides can also be used to aid wound healing and epithelial
colliproprides can also be used to aid wound healing and epithelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antiproliferative, cytostatic, cardiant, vasotropic, cerebroprotective, neuroprotective, antibacterial; virucide, fungicide, opthalmalogical, vulnerary; autoimmune disease, hyperproliferative disorder; cardiovascular disorder, cerebrovascular disorder, infection, nervous system disorder; ocular disorder; chemotaxis; food additive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. Included in the invention are oligonucleotides AAPF63780 - AAPF63788 and peptide AABP5239 which are used in the identification and characterisation of the DNA and protein sequences of
           Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gene 20 human secreted protein homologous amino acid sequence #133.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; immunosuppressive; antiarthritic; antirheumatic; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

This invention relates to polynucleotide sequences AAF63789 - AAF63836
which encode human secreted proteins AAB75260 - AAB75287. Included in the
invention are protein sequences AAB75289 - AAB75341 which are fragments
of the secreted proteins and amino acid sequences with which these
cf fragments share homology. Examples of the activities of the proteins and
polynucleotides and the activities of their agonists and antagonists
cf fragment since include, immunosuppressive; antiarthritic; antirheumatic;
antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective;
cnotropic; neuroprotective; antiarthritic; antirheumatic;
antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective;
coptialmalogical; and vulnerary activity. The protein and polynucleotide
coptialmalogical; and vulnerary activity. The protein and polynucleotide
csquences, their agonists and antagonists may be useful for treating,
preventing and diagnosing diseases and disorders such as autoimmune
cc sequences, themedotid arthritis, hyperproliferative disorders e.g.
creplasms of the breast or liver, cardiovascular disorders e.g.
creplasms of the breast or liver, cardiovascular disorders e.g.
creplasms of the breast or liver, cardiovascular disorders e.g.
creplasms of the breast or liver, cardiovascular disorders e.g.
creplasms of the breast or liver, cardiovascular disorders e.g.
creprotein, viruses and fungi and ocular disorders e.g. corneal infection.
Cc arrest, creprorection, to prevent skin aging due to sumburn, to maintain
cc cell proliferation, for prevent skin aging due to sumburn, to maintain
cc calls be used as a food additive or preservative to innocrase or decrease
cc storage capabilities. Included in the invention are oligomucleotides
cc therefore the and characterisation of the DNA and protein sequences of
the billication and characterisation of the DNA and protein sequences of

The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the polynucleotides and methods are useful for treating and detecting cancer. The STEAR-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful for delineating value are useful for penerating cancer vaccines. Precision, cytogenetic abnormalities in the chromosomal region that encodes STEAR-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAR-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic;
                                                                                                                                 New composition comprising a substance that modulates the status of STEAP-1-related protein, useful for treating and detecting cancer.

The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The polynucleotides are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STRAP-1 that may contribute to the malignant phenotype. This is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the polymucleorides and methods are useful for treating and detecting cancer. The polymucleorides and methods are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 2
